

## Goal-Directed Perfusion.

Level of Evidence	Low
-------------------	-----

### Consensus Statement

Goal-directed perfusion may play a role in preventing organ injury associated with cardiopulmonary bypass.

### Main Points

- Goal-directed perfusion during cardiopulmonary bypass aims to maintain adequate oxygen delivery through protocolized management of flow, hemoglobin, and perfusion variables.
- Studies suggest it may reduce mild acute kidney injury and possibly lessen organ injury related to bypass.
- However, the optimal targets and the effect on more severe kidney injury or mortality remain uncertain.
